Troubleshooting

Solutions to common issues you might encounter.

Docker Issues

"Cannot connect to Docker daemon"

Cause: Docker Desktop isn't running.

Fix:

1. Start Docker Desktop
2. Wait for it to fully initialize (check menu bar icon)
3. Try again

"Permission denied" on Docker socket

Fix (macOS):

BASH

 Copy

```
sudo chmod 666 /var/run/docker.sock
```

Or enable in Docker Desktop:

1. Settings → Advanced
2. Enable "Allow the default Docker socket to be used"

Fix (Linux):

BASH

 Copy

```
sudo usermod -aG docker $USER  
# Log out and back in
```

Container won't build

Check:

1. Dockerfile syntax is valid
2. Base image exists
3. All COPY source files exist

Debug:

BASH

 Copy

```
cd <task-folder>  
docker build -t test . 2>&1 | tail -50
```

Container starts but commands fail

Enter interactive mode to debug:

BASH

 Copy

```
harbor tasks start-env -p <task-folder> -i
```

Then run commands manually to find the issue.

CI / Check Issues

Checks pass locally but fail in PR

Common causes:

1. Python version mismatch

- Check CI logs for version used
- Test locally with same version

2. Missing dependency

- Ensure all imports are in requirements

3. Path differences

- Use absolute paths everywhere

4. Environment variables

- Don't rely on local env vars

"pinned_dependencies" failure

Fix: Add exact versions to all pip (or npm, etc.) installs. Make sure every Docker base image (and any pulled `image:` lines in `docker-compose.yaml`) includes an immutable `@sha256:<digest>` pin.

DOCKERFILE

[Copy](#)

```
# Before
FROM public.ecr.aws/docker/library/python:3.13-slim-bookworm
RUN pip install numpy pandas

# After
FROM public.ecr.aws/docker/library/python:3.13-slim-bookworm@sha256
RUN pip install numpy==1.26.4 pandas==2.1.0
```

"check_task_absolute_path" failure

Fix: Change relative paths to absolute in `instruction.md`:

Before:

MARKDOWN

[Copy](#)

Edit config/settings.json

After:

MARKDOWN

 Copy

Edit `/app/config/settings.json`

"informative_test_docstrings" failure

Fix: Add docstrings to all test functions:

PYTHON

 Copy

```
def test_output_exists():  
    """Verify the output file is created at /output/result.json."""  
    assert Path("/output/result.json").exists()
```

Agent Issues

API key not working

Check:

1. Key is set correctly:

BASH

 Copy

```
echo $OPENAI_API_KEY
```

1. Base URL is set:

BASH

 Copy

```
echo $OPENAI_BASE_URL  
# Should be: https://api.portkey.ai/v1
```

1. Key hasn't expired (contact Slack if needed)

Agent times out

Possible causes:

- Task timeout too short (increase in task.toml)
- Solution is inefficient
- Environment is slow to start
- Task is too complicated

Fix:

TOML

 Copy

```
# In task.toml  
[agent]  
timeout_sec = 1200.0 # Increase from default
```

Agent passes too often

Your task is too easy. Make it harder by:

- Adding more steps
- Using niche knowledge
- Creating debugging scenarios
- Adding edge cases

Platform Issues

Can't log in

1. Clear browser cache and cookies
2. Try incognito/private mode
3. Verify email address is correct
4. Try different browser
5. Contact Slack if still failing

Upload fails

1. Check file size (< 100MB)
2. Ensure ZIP structure is correct
3. Try a different browser
4. Check internet connection

Session expires frequently

1. Enable "Remember me" on login
2. Check browser isn't blocking cookies
3. Disable interfering extensions

Getting Help

Before asking:

1.  Read the error message carefully
2.  Search this documentation (⌘K)
3.  Check Slack for similar issues
4.  Try the suggested fix

When asking:

Include:

- What you're trying to do
- What's happening instead
- Full error message

- What you've already tried

Bad:

"It's not working"

Good:

"When I run `harbor run -a oracle`, I get `FileNotFoundError: /app/data/input.csv`. The file exists in my task folder and is included in the Dockerfile COPY command. Full error: [paste]"

Where to ask:

- **Slack:** [#ec-terminus-submission](#)
- **Payment issues:** Reach out to Snorkel
